PATENT

SPECIFICATION AMENDMENTS

Please amend the paragraph beginning on page 12, line 3 as follows:

Returning to FIG.1, with further reference to FIG. 1A, the single piece 59 of material comprising the frame 11 is formed into the closed circumference 62 by securing the first and second ends 60,61 with an attachment mechanism 15 such as a piece of metal cannula. The ends 60,61 of the single piece 59 are then inserted into the cannula 15 and secured with solder 25, a weld, adhesive, or crimping to form the closed frame 11. The ends 60,61 of the single piece 59 can be joined directly without addition of a cannula 15, such as by soldering, welding, or other methods to join ends 61 and 62. Besides joining the wire, the frame could be fabricated as a single piece of material 59, by stamping or cutting the frame 11 from another sheet (e.g., with a laser), fabricating from a mold, or some similar method of producing a unitary frame.
